

Case Study: Concentrated Cannabis Extracts Cure Squamous Cell Carcinoma

Robert Melamede, Ph.D.

Biology Dept. UCCS, Cannabis Science Inc,

ABSTRACT

The value and safety of medical marijuana is increasingly realized by people around the world as knowledge of the endocannabinoid system spreads and as word spreads of the impact cannabis based treatments are having on numerous illnesses and conditions. The endocannabinoid system homeostatically regulates all body systems. Through these numerous regulatory activities, the cannabinoid system also regulates appetite, pain, body temperature, mood and consciousness.

Living systems are four dimensional dynamic structures in which all the components interact to create a whole that is greater than the sum of its parts. As such, the dynamical system both buffers and adapts to change (homeostasis). Therefore, to implement directed systemic change, for example creating a body that rejects its cancer, is unlikely to occur from a single magic bullet approach.

In contrast to conventional pharmaceuticals, the Cannabis sativa plant produces well over a hundred biologically active cannabinoids, terpenes, and terpenoid compounds. Thus the plant impacts on the body in a holistic manner while targeting a central regulator of homeostasis, the endocannabinoid system.

Dramatic sequential photographic documentation of a squamous cell cancerous tumour being cured by the topical application of cannabis extracts will be presented.

PROCEDURE AND RESULTS

The series of photos below documents the disappearance of a biopsied squamous cell tumor after self-administration of topical cannabis extracts over a 3 month period. After treatment with cannabis extract, the tumor was expelled from below the surface, killed, and healed.
